TRIGONOMETRY

Trigonometry is a branch of <u>mathematics</u> that studies <u>triangles</u> and the relationships between the lengths of their sides and the angles.
It is derived from three small Greek words **tri + gono+ metry**

Tri---- three,   Gono---- angle,   Metry----- measurement

Angle: An angle can be formed by the union of two rays or two lines with a common point(called vertex).

1. If an angle measured in anticlockwise direction then it is positive .

2. If an angle measured in clockwise direction then it is negative.

Angles are measured using the following units:

1.Sexagesimal degree (°)

If the circumference of a circle is divided into 360 equal parts, the central angle corresponding to each of its 360 parts is an angle of one degree sexagesimal, (1°).

A **degree** has **60 minutes** (')$[1^0 = 60']$and a **minute** has **60 seconds** ('') $[1' = 60'']$.

2. Radian (rad): It is the measure of an **angle** whose **arc is a ratio.**

$$2\pi \, radian = 360^0 \quad and \, \pi \, radian = 180^0$$

$$1 \, radian = \frac{180^0}{\pi} \, and \, 1^0 = \frac{\pi}{180} radian$$

Figure

Radian measurement

Conversion from Degree to Radian:

$$30^0 = 30 \times \frac{\pi}{180} = \frac{\pi}{6}$$

$$60^0 = 60 \times \frac{\pi}{180} = \frac{\pi}{3}$$

$$90^0 = 90 \times \frac{\pi}{180} = \frac{\pi}{2}$$

$$150^0 = 150 \times \frac{\pi}{180} = \frac{5\pi}{6}$$

$$270^0 = 270 \times \frac{\pi}{180} = \frac{3\pi}{2}$$

Conversion from Radian to Degree:
$$\frac{\pi}{2} = \frac{\pi}{2} \times \frac{180}{\pi} = 90^0$$

Trigonometric Ratios:

It is the ratio of the sides of a right angled triangle with respect to base angle.

We have six trigonometric ratios like sine, cosine, tangent, cotangent, secant and cosecant.(i.e sin, cos, tan ,cot ,sec and cosec).

How to find all trigonometric ratios from a right angled triangle.

In a right triangle, the following trigonometric ratios can be defined:

Let $\langle B = \theta, \langle A = 90, and \langle C = 90 - \theta,$

$$Let\ AB = c = Base, AC = b = Perpendicular\ and\ BC = a = Hypotenuse.$$

Sine

The **sine** of the angle θ is the ratio between the length of the **opposite side(Perpendicular)** and the **hypotenuse** of the triangle.

It is denoted by **sinθ**

$$sin\theta = \frac{perpendicular}{hypotenuse} = \frac{b}{a} \; or \; \frac{p}{h}$$

Cosine

The **cosine** of the angle θ is the **ratio** between the length of the **adjacent side(base)** and the **hypotenuse** of the triangle.

It is denoted by **cosθ**.

$$cos\theta = \frac{base}{hypotenuse} = \frac{c}{a} \; or \; \frac{b}{h}$$

Tangent

The **tangent** of the angle θ is the **ratio** between the length of the **opposite side(perpendicular)** and the **adjacent side(base)** of the triangle.

It is denoted by **tanθ.**

$$tan\theta = \frac{b}{c} \; or \; \frac{p}{b}$$

Cotangent

The **cotangent** of the angle θ is the **inverse** of the **tangent** of θ.

It is denoted by **cotθ.**

$$cot\theta = \frac{c}{b} \; or \; \frac{b}{p}$$

Secant

The **secant** of angle θ is the **inverse** of the **cosine** of θ.

It is denoted by **secθ.**

$$sec\theta = \frac{a}{c} \ or \ \frac{h}{b}$$

Cosecant

The **cosecant** of angle θ is the **inverse** of the **sine** of θ.

It is denoted by **coscecθ.**

$$cosec\theta = \frac{a}{b} \ or \ \frac{h}{p}$$

Formula 1:

$$sin\theta cosec\theta = 1, sin\theta = \frac{1}{cosec\theta}, cosec\theta = \frac{1}{sin\theta}$$

$$tan\theta cot\theta = 1, tan\theta = \frac{1}{cot\theta}, cot\theta = \frac{1}{tan\theta}$$

$$cos\theta sec\theta = 1, cos\theta = \frac{1}{sec\theta}, sec\theta = \frac{1}{cos\theta}$$

Formula 2:

$$sin^2\theta + cos^2\theta = 1, sin^2\theta = 1 - cos^2\theta, cos^2\theta = 1 - sin^2\theta$$

$$1 + tan^2\theta = sec^2\theta, sec^2\theta - tan^2\theta = 1, sec^2\theta - 1 = tan^2\theta$$

$$1 + cot^2\theta = cosec^2\theta, cosec^2\theta - cot^2\theta = 1, cosec^2\theta - 1 = cot^2\theta$$

Formula 3: $\qquad tan\theta = \frac{sin\theta}{cos\theta} , cot\theta = \frac{cos\theta}{sin\theta}$

INVERSE TRIGONOMETRIC FUNCTION

Inverse Function : A function $f: X \rightarrow Y$ is said to be invertible (i.e $f^{-1}\ exist$) if it is bijective i.e one-one and on-to.

Here X is the domain and Y is the range of the function ,so $f^{-1}: Y \rightarrow X$.

If $y = f(x) \Rightarrow x = f^{-1}(y)$,Here the domain is Y and range is X.

Now consider a trigonometric function $y = sinx$ which is not bijective in R.

So we have to restrict its domain in $\left[-\frac{\pi}{2}.\frac{\pi}{2}\right]\ corresponding\ to\ the\ range$ $[-1,1]$ then the function sinx is bijective .

Now $sin: \left[-\frac{\pi}{2}.\frac{\pi}{2}\right] \rightarrow [-1,1]$ is bijective and its inverse will exist,which can be written as $sin^{-1}: [-1,1] \rightarrow \left[-\frac{\pi}{2}.\frac{\pi}{2}\right]$

Hence $y = sinx \Rightarrow x = sin^{-1}y$

Note :$sin^{-1}x \neq (sinx)^{-1} = \frac{1}{sinx}$

Note: $f^{-1}Of(x) = f^{-1}f(x) = f^{-1}(y) = x$

$fOf^{-1}(y) = f(f^{-1}(y)) = f(x) = y$

Let us consider a function $y = sinx$ then its inverse exist and which is written as $x = sin^{-1}y$
